

# **Biodiversity for the National Parks analyzed**

## **Observation no 1: Endangered species**

# Data analyzed

The analyzed data includes information about endangered species in the National Parks. It includes information such as:

- The scientific name of each species
- The common names of each species
- The species conservation status

|                     |   |
|---------------------|---|
| Categories          | 7 (Mammal, Bird, Reptile, Amphibian, Fish, Vascular Plant, Nonvascular Plant)   |
| Scientific names    | 5541  |
| Common names        | 5504  |
| Conservation status | <p>4 (Species of Concern, Endangered, Threatened, In Recovery):</p> <ul style="list-style-type: none"><li>• <b>Species of Concern</b>: declining population or appears to be in need of conservation.</li><li>• <b>Threatened</b>: vulnerable to endangerment in the near future.</li><li>• <b>Endangered</b>: seriously at risk of extinction.</li><li>• <b>In Recovery</b>: formerly <b>Endangered</b>, but currently not in danger of extinction throughout all or a significant portion of its inhabitable range.</li></ul> |

## How many species fall under each conservation status?

|                    |      |
|--------------------|------|
| Endangered         | 15   |
| In Recovery        | 4    |
| Species of Concern | 151  |
| Threatened         | 10   |
| No Intervention    | 5363 |

# Investigating endangered species

|                   |      |
|-------------------|------|
| Amphibian         | 8,8% |
| Bird              | 15%  |
| Fish              | 8,7% |
| Mammal            | 17%  |
| Reptile           | 6,4% |
| Vascular Plant    | 15%  |
| Nonvascular Plant | 1%   |

# Are certain types of species more likely to be endangered? - chi-squared test

Null hypothesis: difference between endangered Birds and Mammals is due to chance.

Since  $p\text{-val} > 0.05$ , the difference is not significant.

# Are certain types of species more likely to be endangered? - chi-squared test

Null hypothesis: difference between endangered Reptiles and Mammals is due to chance.

Since  $p\text{-val} < 0.05$ , the difference is significant.

That indicates that Reptiles have less chance of becoming endangered than Mammals.

# Recommendation

Scientists should introduce a programme that focuses on most endangered species. Since the difference is significant, scientist should focus on inventing means of protecting **Mammals**.

## Observation no 2: Movement of sheep

The subject of the analysis is number and species that can be found in national parks.

|   | <b>park_name</b>                    | <b>observations</b> |
|---|-------------------------------------|---------------------|
| 0 | Bryce National Park                 | 250                 |
| 1 | Great Smoky Mountains National Park | 149                 |
| 2 | Yellowstone National Park           | 507                 |
| 3 | Yosemite National Park              | 282                 |

# Observations of sheep in each park per week

# Foot and mouth disease reduction

Park Rangers at Yellowstone National Park have been running a program to reduce the rate of foot and mouth disease at that park. The scientists want to test whether or not this program is working.

Given a baseline of 15% occurrence of foot and mouth disease in sheep at Bryce National Park, if the scientists wanted to be sure that a  $>5\%$  drop in observed cases of foot and mouth disease in the sheep at Yellowstone was significant they would have to observe **at least 870 sheep**.
